

Complete Care Medicine frequently asked questions about PA's

Q: What is a physician assistant? What can a P.A. do?

A: A physician assistant (P.A.) is a licensed health professional who practices medicine under the supervision of a physician. A physician assistant provides a broad range of health care services that were traditionally performed by a doctor. As part of the physician/P.A. team, a physician assistant exercises considerable autonomy in diagnosing and treating illnesses.

What a physician assistant does varies with training, experience, and state laws. In Arizona P.A.'s can provide all of the typically services provided by a family physician. They perform physical exams, diagnose illnesses, develop and carry out treatment plans, order and interpret lab tests, suture wounds, assist in surgery, provide preventive health care counseling, and can write prescriptions. A P.A. can do whatever is delegated to him/her by the supervising physician and allowed by law. They can also treat patients when the physician is away from the practice.

Q: What is the difference between a P.A. and a physician?

A: Physician assistants are trained in the medical model. In some schools they attend many of the same classes as medical students. One of the main differences between P.A. education and physician education is not the core content of the curriculum but the amount of time spent in school. Physicians are also required to do an internship, and the majority also complete a residency in a specialty; P.A.'s do not have to undertake an internship or residency. A doctor has complete responsibility for the care of the patient; P.A.'s share that responsibility with the doctors. Doctors are independent practitioners; P.A.'s practice medicine under the supervision of a physician.

Q: Why do we use physician assistants?

A: In the mid-1960s, physicians and educators recognized a shortage of primary care physicians. To expand the delivery of quality medical care, P.A.'s were introduced as a means of improving treatment and allowing expanded access to medical care. Here at Complete Care Medicine we recognize the value of your time and want to provide you with the care that you deserve. All too often physicians are forced to see 30-40 patients a day and are therefore rushed and cannot properly address your concerns. By using physician assistants we reduce overhead costs which allow us to spend more time with you the patient while still delivering high quality care.

Q: Where do P.A.'s draw the line in what they can treat and what a physician can treat?

A: What a physician assistant does varies with training, experience, and state law. In addition, the scope of the P.A.'s practice corresponds to the supervising physician's practice. In general, a physician assistant will see many of the same types of patients as the physician. The cases handled by physicians are generally the more complicated medical cases or those cases requiring care that is not a routine part of the P.A.'s scope of work. Referral to the physician, or close consultation between the patient, P.A., and physician, is done in unusual or hard to manage cases. Physician assistants are taught to know their limits and refer to or consult with physicians appropriately. It is an important part of P.A. training.

Q: Can P.A.'s prescribe medications?

A: Yes

Q: How much education and training does a P.A. receive?

A: Most P.A. education programs require applicants to have previous health care experience and some college education. The typical applicant already has a bachelor's degree and more than four years of health care experience. Nurses, EMTs, and paramedics often apply to P.A. programs. P.A. programs look for students who have a desire to study, work hard, and be of service. On average, an accredited P.A. program lasts 25 months. P.A. programs are accredited by an independent organization sponsored in part by the American Medical Association. All PA programs must meet the same standard curriculum essentials.

P.A. students typically study anatomy and physiology, pharmacology, microbiology, internal medicine, pediatrics, emergency medicine, obstetrics and gynecology, geriatrics, surgery, and psychology. These classes are taught as both lectures and lab sessions. P.A. students also spend at least one year in clinical rotations. During this period, they treat patients in each of the major disciplines of medicine and perform additional course work on campus.

A P.A.'s education doesn't stop after graduation. P.A.'s are required to take ongoing continuing medical education classes and to be retested on their clinical skills on a regular basis.

Q: What does PA-C stand for? What does the C mean?

A: Physician assistant-certified. It means that the person who holds the title has met the defined course of study and has undergone testing by the National Commission on Certification of Physician Assistants (NCCPA). The NCCPA is an independent organization, and the commissioners represent a number of different medical professions. It is not a part of the P.A. professional organization, the American Academy of Physician Assistants (AAPA). To maintain the C after P.A., a physician assistant must log 100 hours of continuing medical education every two years and take the recertification exam every six years.

Q: When are you going to be a doctor?

A: P.A. training is demanding in its own right. This route to a medical career is neither a short cut, nor an easy way out. P.A.'s are not people who didn't get into or who flunked out of medical school. They decided to become a P.A. for a number of personal reasons. They enjoy what they are doing and get great satisfaction from providing quality, affordable, and accessible health care. Although some P.A.'s may decide to become doctor's later, a P.A. is its own profession, they are not students or doctors in training.

Q: What do doctors think about P.A.'s?

A: Most physicians who have worked with physician assistants like having P.A.'s on staff. The American Medical Association, the American College of Surgeons, the American Academy of Family Physicians, the American College of Physicians, and other medical groups support the physician assistant profession by actively supporting the P.A. certifying commission and the P.A. program accrediting agency. Studies done by the federal government show that P.A.'s provide care that is comparable to physician care.

Here at Complete Care Medicine, we feel that our P.A.'s are well qualified and supported. They care about you and your health and are willing to go the extra mile. Should you have any questions or concerns please do not hesitate to let us know.
